2020 – 2025

Prepared by Rashad Alaa

Power BI · DAX · SQL Star Schema · Supply Chain Analytics

1. Executive Overview

Key Insights

- Realized Revenue stands at \$77M against a Total GMV of \$111.66M — roughly 31% of gross order value never converts to realized revenue.

\$77M Realized Revenue	69.31% Collection Rate %	16.55% Mismatch Rate %	82K Total Orders	500 Total Retailers
----------------------------------	------------------------------------	----------------------------------	----------------------------	-------------------------------

- The Mismatch Rate is 16.55%, while the Collection Rate is 69.31% — these two figures move together, indicating a large share of the revenue gap is tied to order/payment/delivery status inconsistencies rather than pure non-payment.
- Realized Revenue grew consistently year over year: \$8.6M (2020) → \$10.6M (2021) → \$12.9M (2022) → \$13.9M (2023) → \$15.5M (2024) → \$16.0M (2025). Growth visibly decelerates after 2022 (~+50% 2020-22 vs ~+18% 2023-25).

- Revenue is heavily geographically concentrated: Central Canada = \$52M (68%), Western Canada = \$23M (30%), Atlantic Canada = only \$2M (2%).

Realized Revenue by Geographic Region

Realized Revenue

- Product category revenue is led by Food & Beverage (\$41M, 46%), followed by Industrial & Packaging (\$30M, 33%) and Household & Cleaning (\$19M, 21%).

Realized Revenue Share by Product Category

- Payment behavior is split between Electronic Payment (64.6%) and Credit Terms (31.6%), with Cash at only 3.8%.

Realized Revenue by Payment Method

- Supplier revenue follows a Pareto pattern: 47 "Core" (A) suppliers generate 69.47%, 26 "Mid" (B) suppliers generate 24.76%, and 7 "Long-tail" (C) suppliers generate only 5.77%.

2. Logistics & Delivery Operations

Key Insights

- The Delay Rate is 63.62% — nearly two-thirds of all orders experience some form of delay relative to their expected delivery window.

- Order distribution by delay status is bimodal: Early = 26.5K, Severe Delay (12-72h) = 21.3K — the second-largest bucket overall — Moderate = 12.3K, Minor = 8.9K, Major = 5.2K, Pending = 4.0K, Extreme = 2.5K.

- On-Time Rate % by month shows a strong seasonal pattern: performance sits near 20% in Jan-Mar, then rises sharply to a stable ~40% plateau from Apr through Nov, dropping again toward year-end.

On-Time Rate % by Month Name

- Cash at Risk % by province ranges narrowly from 2.35% (Nova Scotia) to 4.28% (Manitoba), with Central provinces (ON, QC) and MB sitting above 3.7%.

Cash at Risk % by province

- Weather impact on delivery timeliness: on-time performance is nearly identical between cold and non-cold cities (47.54% vs 46.97%), but a secondary delivery outcome diverges sharply (40.99% vs 19.51%).

Weather Impact on Delivery Timeliness

- Cross-status anomalies by severity: Critical = 6.4K, High = 4.1K, Medium = 3.0K — anomaly volume skews toward the most serious classification.

- Of 82K total orders, only 67K (~82%) show as "Orders Delivered"; Delivery Failure (2.91%) and Cancellation (4.88%) together account for under 8%, leaving ~10% of orders in an unclassified state.

Business Problems

- Majority of orders are delayed: the overall Delay Rate is 63.62% — most orders do not arrive within their expected delivery window.

- Severe Delay is a major volume bucket, not an edge case: 21.3K orders fall into "Severe Delay (12-72h)" — the second-largest delay bucket, larger than Minor and Major combined.

- Seasonal collapse in on-time performance: On-Time Rate drops to ~20% in January-March each year, versus a stable ~40% plateau April-November.

On-Time Rate % by Month Name

- High-severity anomalies dominate: 6.4K "Critical"-severity anomalies exist — more volume than the "Medium" tier (3.0K).

Cross-Status Anomalies by Severity

- Unclassified order volume: only 67K of 82K orders are marked "Delivered"; Failure + Cancellation account for under 8% combined, leaving ~10% of orders in an ambiguous state.
- Provincial cash-at-risk spread: Cash at Risk % varies from 2.35% to 4.28% across provinces — a gap of nearly 2 percentage points.

Cash at Risk % by province

- Winter-driven divergence in specific delivery outcomes: while overall on-time rates are similar between winter and non-winter months, a secondary delivery-outcome metric shows a much larger gap (40.99% vs 19.51%).

Recommendations

- Conduct a focused review of the Jan-Mar on-time collapse, aligning staffing, carrier capacity, or route planning to this seasonal pattern ahead of each Q1.
- Treat Severe Delay orders as a distinct operational tier, with a dedicated tracking/escalation path for orders that cross into the Severe threshold.
- Resolve the ambiguous ~10% of orders by tightening status definitions and closing the gap in the operational status taxonomy.
- Direct the Critical-severity anomaly volume (6.4K) to a fast-track review queue.
- Benchmark the highest cash-at-risk provinces (MB, ON, QC) against the lowest (NS, AB, SK) to identify explanatory factors, applying learnings where feasible.
- Track the diverging winter-specific delivery outcome (40.99% vs 19.51%) separately during winter months rather than relying on the on-time rate alone.

3. Retailer Performance

Key Insights

- Of 489 Active Retailers, Average Order Value (AOV) is \$1.36K and Order Frequency is 116.86, producing an Average Revenue Per Retailer (ARPR) of \$159K.

489 Active Retailers	1.36K AOV	116.86 Order Frequency	\$159K ARPR	76.27% Revenue Concentration Top 20%
-------------------------	--------------	---------------------------	----------------	---

- Revenue Concentration (Top 20%) = 76.27% — the top fifth of retailers generate more than three-quarters of total revenue.
- Active Retailer Growth (YoY) was volatile early on: +3.23% (2021) → -1.83% (2022) → +0.80% (2023) → +3.69% (2024) → +6.87% (2025). 2022 is the only contraction year, with growth accelerating since.

Active Retailers Growth (YoY)

- RFM Segmentation concentrates retailers at the healthy end: Champions = 29K, Loyal Customers = 28K, Potential Loyalists = 15K, versus much smaller At Risk (4K), New (3K), and Hibernating (1K) segments.

- Pareto Analysis by Segment: Champions alone contribute 46.65% of realized revenue, reaching 78.65% cumulative by Loyal Customers and 92.50% by Potential Loyalists.

Pareto Analysis: Revenue Contribution by Segment

- The Annual Cohort Retention Matrix shows the 2019 cohort declining from 86.46% (month 1) to 72.92% (month 6) — a clear erosion pattern within its first six months.

Annual Cohort Retention Matrix

cohort_year		0	1	2	3	4	5	6	Total
2019			86.46%	85.42%	76.04%	71.88%	73.96%	72.92%	91.67%
2020		86.42%	89.51%	91.36%	79.01%	80.25%	80.25%		100.00%
2021	82.88%	90.09%	88.29%	90.09%	78.38%	81.98%			97.30%
2022	100.00%	100.00%	98.25%	98.25%	96.49%				100.00%
2023		100.00%	100.00%	100.00%					100.00%
2024		100.00%	100.00%						100.00%
2025		100.00%							100.00%
Total	29.80%	74.20%	86.20%	82.40%	68.60%	58.00%	40.20%	14.00%	97.80%

Business Problems

- Extreme revenue concentration in the retailer base: the top 20% of retailers generate 76.27% of total revenue.

489 Active Retailers	1.36K AOV	116.86 Order Frequency	\$159K ARPR	76.27% Revenue Concentration Top 20%
-------------------------	--------------	---------------------------	----------------	---

- RFM segment concentration: Champions alone contribute 46.65% of realized revenue, and the top three RFM segments account for 92.50% combined.

Pareto Analysis: Revenue Contribution by Segment

- Supplier concentration: just 47 "Core" suppliers generate 69.47% of supplier-segment revenue, while 7 "Long-tail" suppliers generate only 5.77%.

- Geographic concentration: Central Canada accounts for 68% (\$52M) of realized revenue, while Atlantic Canada contributes only 2% (\$2M).

- Negative retailer growth year: Active Retailer Growth (YoY) was negative in 2022 (-1.83%) — the only contraction year in the 2021-2025 series.

- Cohort retention decay: the 2019 retailer cohort's retention rate declined from 86.46% (month 1) to 72.92% (month 6).

Annual Cohort Retention Matrix

cohort_year		0	1	2	3	4	5	6	Total
2019			86.46%	85.42%	76.04%	71.88%	73.96%	72.92%	91.67%
2020		86.42%	89.51%	91.36%	79.01%	80.25%	80.25%		100.00%
2021	82.88%	90.09%	88.29%	90.09%	78.38%	81.98%			97.30%
2022	100.00%	100.00%	98.25%	98.25%	96.49%				100.00%
2023		100.00%	100.00%	100.00%					100.00%
2024		100.00%	100.00%						100.00%
2025		100.00%							100.00%
Total		29.80%	74.20%	86.20%	82.40%	68.60%	58.00%	40.20%	97.80%

- At Risk and Hibernating segments exist at meaningful scale: 4K retailers are "At Risk" and 1K are "Hibernating".

Recommendations

- Develop a formal retention program targeted at the At Risk (4K) and Hibernating (1K) RFM segments before they convert to Lost.
- Build a structured account-management program for the top 20% of retailers, alongside a parallel effort to grow Potential Loyalists into Loyal/Champion status.
- Diversify supplier dependency by developing a subset of the "Mid" (B) supplier segment toward "Core" (A) status.
- Evaluate targeted growth initiatives in Atlantic and Western Canada, given their combined 32% share versus Central Canada's 68%.
- Investigate the causes of the 2022 negative retailer growth (-1.83%) to prevent recurrence, given growth has since recovered and accelerated.
- Apply the retention pattern observed in the 2019 cohort as an early-warning benchmark for newer cohorts, enabling proactive outreach before a similar decay point.

4. Financial Health

Key Insights

- Cash Collected = \$83.74M against Outstanding Receivables of \$8.66M and Anomaly Cash Exposure of \$18.81M — the anomaly exposure is more than double the outstanding receivables.

- Cash at Risk % = 3.61%, closely aligned with the province-level range seen on the Logistics page (2.35%-4.28%), suggesting the national blended rate falls roughly mid-range across provinces.
- The Cash Reconciliation & Revenue Leakage Waterfall starts at Cash Collected (\$83.74M), adds Cash Pending (+\$16.68M), then subtracts Cash at Risk (-\$2.90M), Failed Delivery Exposure (-\$3.00M), and Cash Lost/Reversed (-\$5.35M), arriving at \$89.17M — \$11.25M in combined leakage.

Cash Reconciliation & Revenue Leakage Waterfall

● Increase ● Decrease ● Total

- GMV & Order Distribution by Operational Status: Fulfilled = \$91.15M / 66,628 orders, Delivery Exception = \$14.13M / 10,438 orders, Cancelled = \$5.35M / 3,995 orders, In Progress = \$1.03M / 776 orders.

GMV & Order Distribution by Operational Status

Operational Status	Total GMV	Total Orders
☐ Fulfilled	\$91,154,172	66,628
☐ Delivery Exception	\$14,127,148	10,438
☐ Cancelled	\$5,345,336	3,995
☐ In Progress	\$1,034,521	776
Total	\$111,661,177	81,837

- Monthly Cash Inflow vs. Pending Closure rises gradually from January through October, then shows a sharp acceleration in November-December.

- AR Aging distribution: 0-30 days = 47K (dominant bucket), 31-60 days = 9K, 60+ days = 5K, and Not Paid = 21K — larger than the 31-60 and 60+ buckets combined.

Accounts Receivable (A/R) Aging Analysis

Business Problems

- Gross-to-realized revenue gap: of \$111.66M in total GMV, only \$77M is realized revenue — nearly one-third of order value (\$34.66M) never converts.

\$77M Realized Revenue	69.31% Collection Rate %	16.55% Mismatch Rate %	82K Total Orders	500 Total Retailers
----------------------------------	------------------------------------	----------------------------------	----------------------------	-------------------------------

- Low Collection Rate: only 69.31% of expected value is actually collected.
- High Mismatch Rate: 16.55% of orders carry status inconsistencies across order/delivery/payment states.
- Anomaly Cash Exposure exceeds standard receivables: \$18.81M, more than double the Outstanding Receivables figure of \$8.66M.

\$83.74M Cash Collected	\$18.81M Anomaly Cash Exposure	\$8.66M Outstanding Receivables	\$2.49M Wasted Delivery Effort	3.61% Cash at Risk %
-----------------------------------	--	---	--	--------------------------------

- Cash reconciliation leakage: \$11.25M is lost between Cash Pending and final reconciled cash, before revenue is even realized.

Cash Reconciliation & Revenue Leakage Waterfall

- Large "Not Paid" AR bucket: 21K invoices sit in "Not Paid" status — larger than the 31-60 day and 60+ day aging buckets combined (14K).

Accounts Receivable (A/R) Aging Analysis

- Wasted Delivery Effort: \$2.49M in delivery effort is classified as wasted, representing cost incurred without corresponding realized value.

Recommendations

- Introduce automated order/delivery/payment status validation at the point of status change, so mismatches are flagged before they reach reconciliation.
- Prioritize root-cause analysis on Anomaly Cash Exposure specifically, since it is more than double Outstanding Receivables — treat it as a separate, higher-priority workflow from standard AR collections.
- Set a formal SLA for orders sitting in "Not Paid" status (e.g., escalate to collections or write-off review after a fixed number of days).
- Establish a monthly reconciliation checkpoint that tracks the GMV → Cash Collected → Realized Revenue waterfall as a single KPI chain.
- Investigate the drivers of "Wasted Delivery Effort" (\$2.49M) — failed-delivery attempts, address/data errors, or scheduling.

5. Cross-Cutting Structural View

Observations, problems, and recommendations that span more than one dashboard page rather than belonging to a single one.

Cross-Dashboard Observations

- The \$111.66M GMV → \$89.17M reconciled cash → \$83.74M cash collected → \$77M realized revenue figures form a consistent waterfall across the four pages, each layer stripping out a further category of leakage.
- The 16.55% Mismatch Rate is numerically close to the share of orders in Delivery Exception + Cancelled + In Progress status (~18.6% of orders), suggesting these non-Fulfilled operational statuses are a primary driver of the mismatch figure.
- Both the Delay Rate (63.62%) and Cash at Risk rate (3.61%) point to a pattern where operational delay is common but does not proportionally translate into financial risk — delay is roughly 17x higher than cash-at-risk.
- Revenue concentration appears at multiple levels simultaneously: geographic (Central Canada 68%), retailer (top 20% = 76.27%), RFM segment (top 3 = 92.5%), and supplier (Core suppliers = 69.47%) — a recurring structural pattern across every dimension of the business.

Business Problems

- Compounding leakage across the value chain: the same order base loses value at multiple sequential stages — GMV (\$111.66M) → reconciled cash (\$89.17M) → cash collected (\$83.74M) → realized revenue (\$77M).
- Overlap between operational and financial problems: the 16.55% Mismatch Rate aligns closely with the share of orders in Delivery Exception, Cancelled, and In Progress statuses (~18.6% of orders).
- Concentration risk is systemic, not isolated: high concentration appears simultaneously across geography, retailers, RFM segments, and suppliers.

Recommendations

- Establish a single cross-functional KPI dashboard view (already partially achieved via this Power BI build) that tracks the GMV-to-revenue waterfall, delay rates, and concentration metrics together.
- Since the Mismatch Rate closely tracks the share of orders in Delivery Exception/Cancelled/In Progress status, route financial reconciliation review and operational status review through the same team or process.
- Treat diversification as a portfolio-level objective — set explicit concentration thresholds (e.g., max % revenue from top region/segment/supplier group) and monitor them alongside growth KPIs.
